August 2026

This note has been folded into the main paper. The dimension-complexity result it stated and proved — $D(\varepsilon) = \Theta(\log(1/\varepsilon))$ for the I_{3322} quantum value, with the explicit derived constant 23.9010650 on the upper half — now appears, with the same content and the same certificate anchors, as Section 5 of

S. Douglas, *The I_{3322} quantum value is attained spatially but not in finite dimension*,
[paper/resolution.tex](#) / [paper/resolution.pdf](#) in this repository.

The certificates are unchanged and remain at `certificate/production/rate-theta-log/` (the sealed lower-bound chain `lower-v28.1-bundle/` and the upper-bound bundle `upper-U1G-bundle/`), together with their complete audit records. The standalone version of this note is preserved verbatim in the frozen v3.3.0 release of this repository, archived at DOI [10.5281/zenodo.21843326](https://doi.org/10.5281/zenodo.21843326) (whose Zenodo metadata carries a stale “3.2.3” version string from the metadata file shipped at tag time; its archive is the v3.3.0 tree).

Why the merge: the rate result is the quantitative completion of the main paper’s nonattainment theorem, and keeping the two statements in separate documents produced avoidable drift between them. One paper, one set of claims, one citation.
